### An Investigation Of Hydraulic Line

An investigation of fluid resonance in high-pressure hydraulic lines has been made with two types of fluid dampers (or filters) installed in the line. One type involved the use of one or more closed-end tubes branching at right angles from a main line, and the other type was a fluid muffler installed in-line.

Hydraulic Brake Line Corrosion: An Initial Investigation of the Problem 690530 At the 1965 SAE Mid-Year Meeting in Chicago, fleet operators commented on hydraulic brake tube failures. Since little factual information was available on the effects of service life on the performance of hydraulic brake lines, a program was initiated to obtain this information.

An experimental study was performed using a test rig (with a water-glycol as hydraulic fluid) which closely replicates the operation of a hydraulic cylinder. As piston rod seal failure is the foremost cause for leakage, experiments were performed using unworn, semi-worn, and worn piston rod seals.

Fire investigators theorize that a small pinhead leak developed in the lines while the victim was welding. This leak allowed the pressurized hydraulic oil to escape and atomize into the immediate work area. Sparks from the welding process were the ignition source. There were no eyewitnesses to the incident.

3 A brake line which should have burst when tested at 1 1 5,832 to 158,579 kPa (1 6,800 - 23,000 psi), in fact, burst at 4,825 kPa (700 psi). The paper states, "This particular tube portion was located at the end, above and behind the rear axle, and showed a great deal of corrosion, perhaps due to gravel impingement."

### Applications: Automotive - Hydraulic Brake Tube

Hydraulic fracturing is widely used for the stimulation of oil and gas reservoirs in addition to the reconstruction of enhanced geothermal systems that target reservoirs. However, hydraulic

fracturing behaviour is not comprehensively understood and requires further investigations.

The four basic line types in a hydraulic system are pump suction, return (Low pressure <100 PSI), medium pressure (500 to 2000 PSI), and high pressure (2100 to 5000 PSI). Under-sizing fluid lines will result in high pressure loss and system overheating. Over sizing lines increases the cost of the system. Lines should be sized as follows:

Hydraulic hoses are put through rigorous applications every day, which eventually take their toll. If not inspected on a regular basis, abrasion can cause a hose assembly to burst and leak. Excessive rubbing of the hose against an external object or even another hose can wear away the cover and eventually the reinforcement layers.

Hydraulic circuits are often applied in chemical processing (flow systems). Hydraulic Pumps. Mechanical power is converted into hydraulic energy using the flow and pressure of a hydraulic pump. Hydraulic pumps operate by creating a vacuum at a pump inlet, forcing liquid from a reservoir into an inlet line, and to the pump.
