This work is motivated by the fact that it is impossible for an observer to know at time $t = 0$ all the initial data of a system, if that data is specified in the conventional manner on the spacelike surface $t = t_0$.

Hamiltonian formulation for classical mechanics, first given by Dirac, is exploited, in which dynamical variables are specified by their values on an observer's past light cones.

Classical mechanics describes the motion of macroscopic objects, from projectiles to parts of machinery, and astronomical objects, such as spacecraft, planets, stars and galaxies.. If the present state of an object is known it is possible to predict by the laws of classical mechanics how it will move in the future (determinism) and how it has moved in the past (reversibility).

This first course in the physics curriculum introduces classical mechanics. Historically, a set of core concepts—space, time, mass, force, momentum, torque, and angular momentum—were introduced in classical mechanics in order to solve the most famous physics problem, the motion of the planets. These reduced dimensionality models provide one means to correct for the improper classical mechanical treatment of zero-point motion in complete benzene models. They give significantly smaller homogeneous linewidths for the low energy CH(D) ...
