Concept Review Section Energy Transfer

Energy can be transferred from one object to another by

doing work. To do work requires that an agent exert a force on an object over a distance. When work is done, energy is transferred from the agent to the object, which results in a change in the object's motion (more specifically, a change in the object's kinetic energy).

The addition of heat energy allows for the increase in phase energy from solid to liquid. The energy addition is converted to a different form; thus, the temperature does not change.

Conduction is heat transfer via direct contact between two objects, which describes the transfer between the hot surface and the ice.
